**In-situ Thermal Conductivity Testing since 1994** [www.geotctest.com](http://www.geotctest.com)

**Thermal Conductivity by Direct Measurement Test Results**  
**Client: The GreyEdge Group, LLC**  
**520 South 3<sup>rd</sup>. Street, Carbondale, Colorado 81623**

To Whom It May Concern:

A **forty-eight (48.9)** hour in-situ thermal conductivity test was performed on the **28<sup>th</sup>, 29<sup>th</sup>, and 30<sup>th</sup>**, of **November 2023**. The test was performed for the GreyEdge Group, LLC at the borehole drilled on November 16 through the 20<sup>th</sup>, at the 3<sup>rd</sup> Street Center at 520 S. 3<sup>rd</sup>, Street in Carbondale, Colorado 81623. Testing was done with a certified Ewbank portable test unit. The in-situ test data was acquired by Mr. Duane Harman, P.E. and witnessed by Mr. Garen Ewbank with Ewbank Geo Testing, LLC, 115 Woodcreek Drive, Fairview, OK 73737 and Mark Smith with Sound Geothermal of South Jordan, Utah.

The borehole was **five and five-eighths (5-5/8")** inches in diameter and was **four hundred and forty-nine (449')** feet in depth. A **one inch and one-fourth inch (1-1/4") SDR-11 4710 HDPE** loop was installed and the borehole and grouted with graphite enhanced bentonite grout to surface. Static water level was unknown. The average deep earth temperature was **fifty-six and three-tenths (56.3 °F) degrees Fahrenheit**, which indicates the averaged undisturbed deep earth temperature. The power input was **17.45 watts per foot** of borehole.

The average thermal conductivity (**k**) for the ground heat exchanger as installed was **1.69 Btu / (hr-ft-°F)**. This is an average conductivity per foot for the ground heat exchanger as constructed and tested. The thermal conductivity value represents the rate at which the ground heat exchanger and earth transfer heat. This value is required to determine the amount of ground heat exchanger for the design loads of the facility to transfer to or from the ground loads. The thermal diffusivity was estimated at 1.118 ft<sup>2</sup> per day from the drilling log provided. The borehole resistance was estimated at 0.244 (hr-ft-°F) / Btu.

This test data was acquired under the recommendations of the International Ground Source Heat Pump Association (IGSHPA) and the American Society of Heating, Refrigeration, and Air conditioning Engineers (ASHRAE). The line source method(s) was used to determine the above thermal conductivity.

Additional numerical analysis was conducted using advanced thermal response testing (A-TRT) and digital twinning. This produced direct measurements of the volumetric heat capacity, grout thermal conductivity, and earth thermal conductivity. That report by Rick Clemenzi, P.E., follows and determined the earth thermal conductivity of 1.66, earth volumetric heat capacity of 22.7, grout thermal conductivity of 1.30, grout volumetric heat capacity of 37 and thermal diffusivity of 1.76. The difference of the estimated and measured diffusivity (leading to volumetric heat capacity) is very important in designing an ambient temperature loop (ATL) connected to a ground heat exchanger as a thermal storage system rather than a heat sink and or source. It is recommended to use these values for design.

Re: Advanced Thermal Response Test Analysis, 520 South 3rd St, Carbondale,  
CO

Enclosed is our GeoAssured™ Advanced Thermal Response Test (A-TRT) Numerical Analyses on the TRT data and well log materials for 520 South 3rd St, Carbondale, CO. The results of this analysis are important for properly designing and sizing Geothermal Heat Exchangers (GHEX).

**Summary**

The results of the A-TRT analyses are summarized as follows:

<u>Description</u>	<u>Ground</u>	<u>Grout</u>	<u>Units</u>
Thermal Conductivity	1.66	1.30	BTU/ft-hr-°F (TC or K)
Volumetric Heat Capacity	22.7	37.0	BTU/ft <sup>3</sup> -°F (HC)
Deep Earth Temperature (avg)	56.8°F		
Calculated Diffusivity	1.76		ft <sup>2</sup> /Day

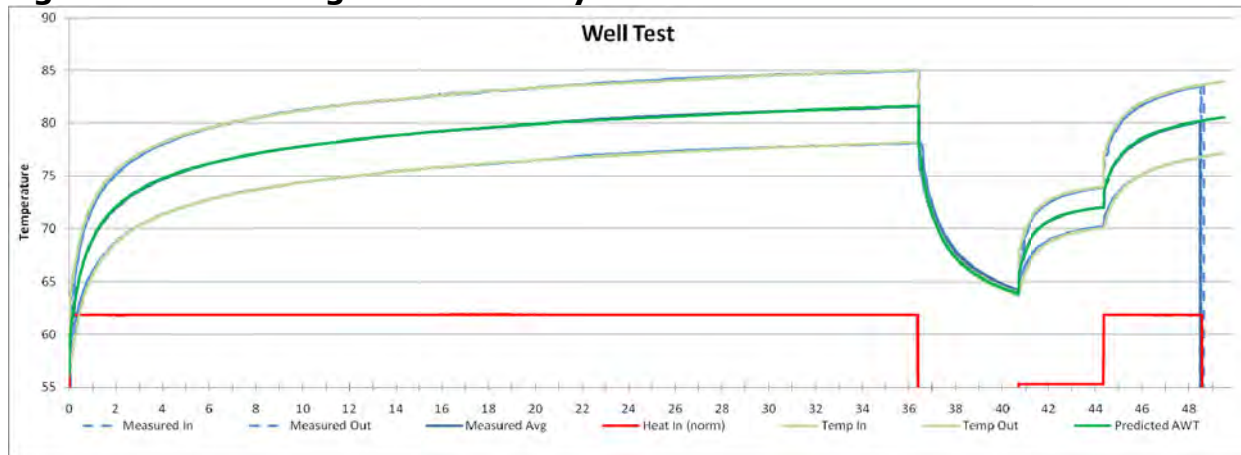

The A-TRT shows there is a significant Thermal Conductivity impact from water movement most likely in the top 120' of unconsolidated soils in the Carbondale valley. This upper layer creates a thermal transfer opportunity which a GHEX designer could perhaps more significantly utilize. The dynamic volumetric movement situation in that layer creates higher Calculated Diffusivity and overall calculated volumetric Heat Capacity figures than a conventional well log based analysis. We include additional technical information below about the tests and results. The A-TRT process and output graphs are explained below in "TRT Technique and Understanding the A-TRT Graphs".

**Analysis**

Figures 1, 2, and 5 below show the final results of the A-TRT Analysis. The nature of these graphs is explained below.

**Test Well and Graphical Results** -- The A-TRT analysis was performed as depicted in Figure 1 below on the data collected from a TRT performed by Ewbank Geo Testing, LLC started November 28 and run for over 49 hours. This well was drilled over 8 days earlier and thus fully rested. The bore was reported as having a 449' 1.25" DR11 loop with "TG Lite / PowerTEC (2:1)" grout. This figure shows the entire 49+ hour test data in blue with intentional power fluctuations after 36 hours

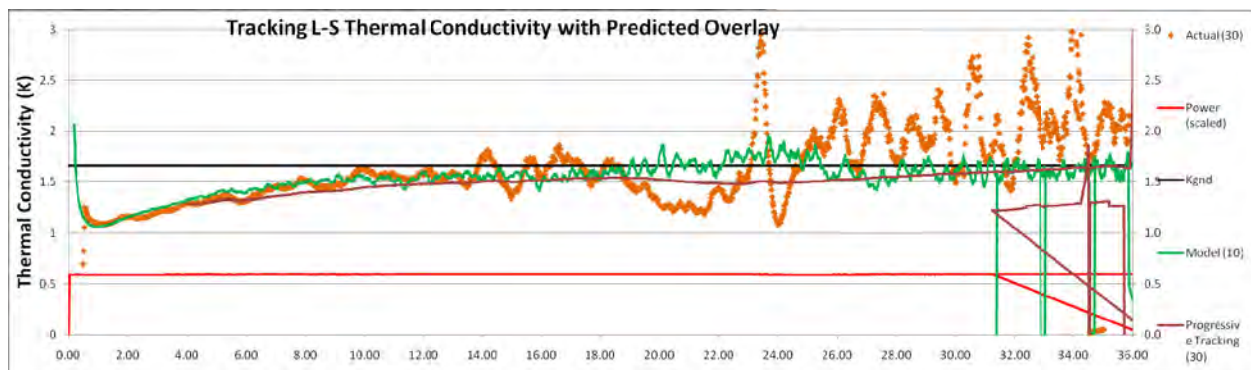

**Figure 1 – A-TRT Digital Twin Analysis Results**

to let us draw more accurate conclusions about the grout and ground properties. The measured temperature data is shown in blue with the A-TRT Numerical Analysis result in green which almost exactly covers the blue collected data showing the quality of the digital twin model created. The four principal conclusions drawn, Thermal Conductivity (TC) and Heat Capacity (HC) of the Grout and Ground, stem from the precision of the curve fit, especially the curve shapes, with each parameter resulting from a different part of the overall increasing and falling temperatures involved. This very high degree of correlation is how we know our conclusions are correct. The numerical results of the A-TRT Analysis are shown in the above Summary table.

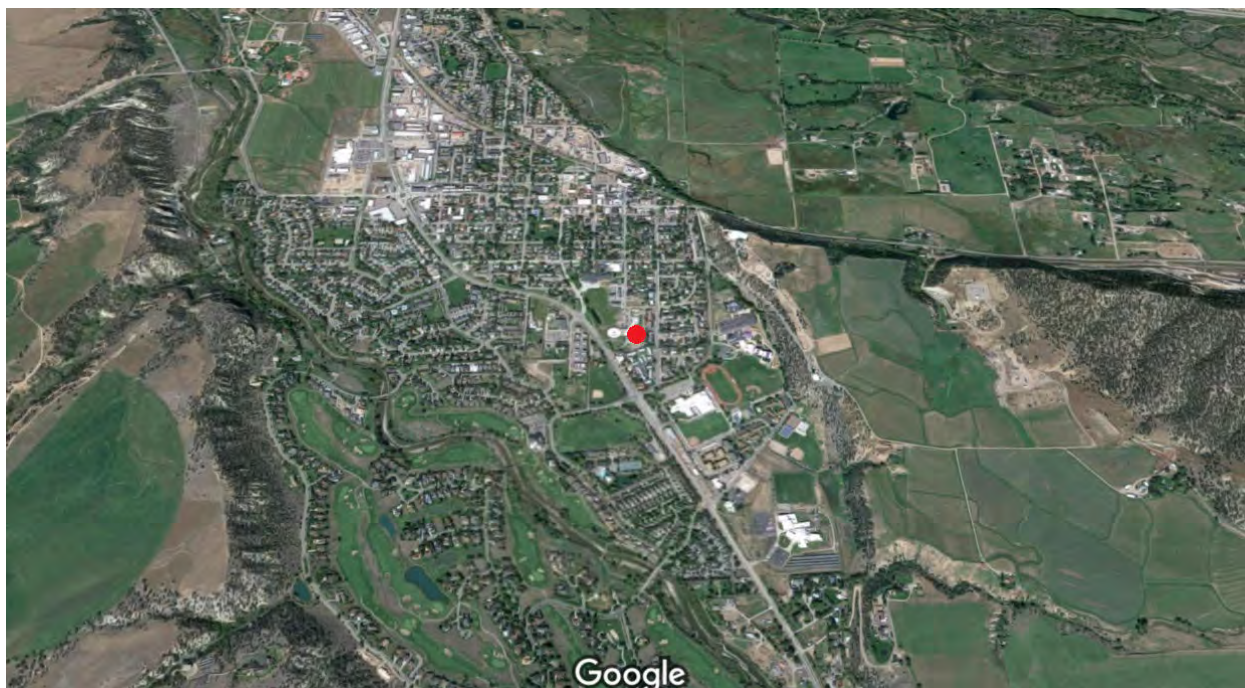

The "TG Lite / PowerTEC (2:1)" grout mixture tested slightly higher than as reported by the manufacturer. GeoPro Inc. suggests a TC value  $K=1.2$  for TG Lite and PowerTEC at the specified 2:1 mixing ratio, but we do not know the exact mixing ratio used by the grout installer which will strongly affect TC. The A-TRT Analysis measures the effective TC of the grout at  $K=1.3$ . We conclude that the likely saturated top 120' with evidence of water movement (below) is causing this increased TC value, a result we have seen other places as well (saturated ground of every kind significantly increases soil and grout TC values).

**Figure 2 - A-TRT Tracking Analysis Results**

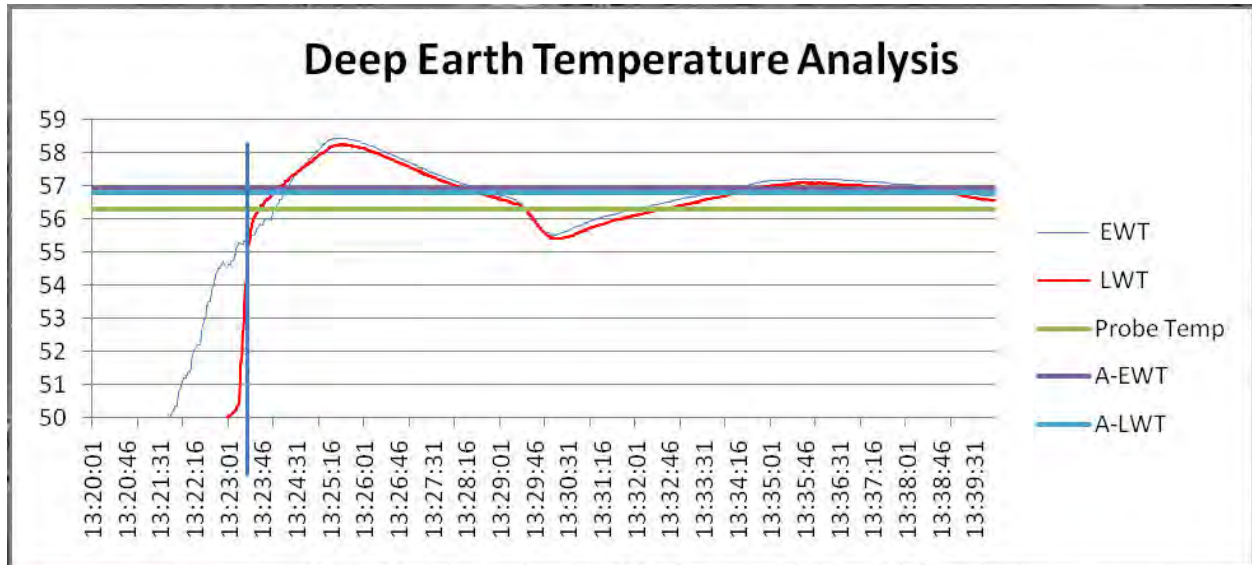

**Tracking Analysis and Water Presence** – A graphic showing our A-TRT Tracking Analysis is in Figure 2. Data shown in this analysis are the concluded TC (horizontal black line), the tracked TC (orange dots), the model determined TC (green), and the Progressive Tracking Result (thin brown line). In consolidated rock formations, this graph shows steady TC values. In Figure 2 we see almost continuous TC spike fluctuations indicating the presence of likely flowing water in at least part of the underlying soil and rock. Review of the driller’s log shows the top 120’ of earth is unconsolidated materials with little to no clay. Such materials are highly porous to water flow. A look at the site in Google Earth (Figure 3) shows a constrained mountain valley area riddled with surface stream drainage features, and with flowing streams and standing surface waters within about 1000’ of the site in multiple directions. This combination of likely fully saturated porous soil is excellent for geothermal use, and fully explains the results observed. However, we caution that the designer should take into account the fact that any TRT results depend on this water presence. Note how the Progressive Tracking curve (thin brown line) earlier settles on a lower TC for the formation which more accurately reflects the result if no water movement were present. The 2<sup>nd</sup> half of this analysis is more inclusive of water movement effects (fundamental to this test) and shows how the ground water movement creates a net higher TC for the overall bore. Using the lower TC value determined without as much water movement involvement the deep earth as taken before heat is applied to the bore by the TRT equipment.

**Figure 3 - Google Earth Map of Carbondale, CO (test location at red dot)**

**Deep Earth Temperature Results** – Figure 4 shows the temperature data from the initial 1 second data collection period. This data begins with a cold TRT test unit, with the equipment getting to ground temperature at about the vertical blue line. Following this point, we see one large thermal dip showing how the initial cold water requires a couple of circulations to fully settle to the ground temperature. The horizontal blue lines represent the averages of the EWT and LWT from only the data following the vertical line “cutting point”. Note this average ground

**Figure 4 - Average Deep Earth Ground Temperature Analysis**

temperature is different than the TRT operator measured “probe temperature data”, but does agree with the average of that more vertically detailed assessment. The GHEX designer should take all ground temperature data into account realizing this location does not have a single average ground temperature as shown in the probe temperature data.

**A-TRT Technique and Understanding the A-TRT Graphs** -- The Advanced TRT process involves pumping plain water inside the loop-under-test, measuring the temperature of the water both entering and leaving the test gear, measuring the flow rate, sometimes adding heat to the water via heater elements or an on-demand water heater, and measuring the power consumed by the pump and optional water heating. Values for each parameter are recorded every second when the testing starts, then drops back to 1 sample per minute once the system is in a stable operation mode. During the one sample every second period, a detailed log of water temperatures is collected to determine the deep earth temperature (wells) or current ground temperature (horizontal loops).

There is no set duration for an A-TRT test provided the output yields a strong correlation with measured data without variable interdependence. This generally requires about 12 hours testing overall for wells in a consolidated formation and

about 2 hours for a horizontal loop. Longer tests are required when looking for Aquifer Water Movement. Tests up to 48 hours are common to ensure highly reliable results, with a minimum 36 hours specified by ASHRAE and ANSI/CSA/IGSHPA C-448 standards. When testing additional bores at a single site, the subsequent tests can be shorter without loss of reliability if the analysis shows TC convergence without variation.

The results of the A-TRT test are the estimated Thermal Conductivity (K: BTU/(ft-hr-°F)) of the Ground and optionally the Grout (wells only), and the estimated Heat Capacity (HC: BTU/cu-ft-°F) of the Ground/Grout. These results are combined to produce an artificial parameter called Diffusivity (sqft/day) used by some software to determine GHEX size.

The principle A-TRT input parameters are the measured In/Out Temperatures (°F), Flow Rate (GPM), and heat rate (Watts or oz-propane/min). Also critical to an accurate result are loop length, pipe configuration, bore diameter/loop spacing, and pipe size with wall thickness (DR rating).

The process of completing an A-TRT evaluation involves setting initial HC conditions from industry accepted tables and iterating on all parameters until a good "simulation correlation" against the actual measured values is achieved. All of the factors affect the resulting curve shape in slightly different ways which is how one can see when one of the inputs is not valid. Our experience has shown that the various rock and soil formations actually have quite varying HC from the common well log based prediction. This is especially true for Grouts which vary widely based on saturation level and quality of Grout mixing. Determining HC and K are the principal steps of the process. Sometimes it becomes clear that one of the basic input parameters is incorrect, such as loop length, which will become obvious from the A-TRT process.

Specifically looking at the principal A-TRT output graphs (Figures 1, 2), the Blue lines are the Measured In/Out water temperatures (dashed Blue) and the computed Mean (solid Blue). The Green lines are the A-TRT Simulation Resulting Mean (solid Green) and computed In/Out water temperatures (dashed Green). Power/Heat Rate and Pumping are shown normalized in Red and Light Orange. For the Horizontal Loop test technique, additional probe temperature tests are taken to confirm ground thermal saturation. A positive correlation result is when the solid Green line matches the solid Blue line during periods of heat being added, and matches the bottom Blue dashed line when no heat is being added. A correlation to the "shape" of the spikes (following detailed minute-by-minute sample collection) is the goal. It is this "shape fit" that indicates a positive conclusion of the A-TRT process more than the exact "level" which is highly dependent on initial conditions.

**Conclusion**

The results are conclusive based on the available data and site location. This is an excellent area for a GHEX. Given the mountain valley location, the surface water level is likely very reliable and thus the results dependable for GHEX use. However, ground water flow is unknown which could lead to slightly varying results across a large GHEX area.

Total  
 Drilling Time:                      7:54    Hrs:Min                      Drilling 0 - 520'

**COMMENTS:** (16NOV) Gravel in the upper 40' of hole caused concern to driller, casing installed after drilling 120' (POOH). Casing consisted of 2x20' 6" dia Cresline HDPE, top ~4.5' were cut after insertion (~35' casing). Casing would not stay seated so drillers packed more hole plug (total 2 bags) and SDFN to allow to set overnight.

(17NOV) Casing reseated with more hole plug (5 addtl bags) and drilling continued without issue to 500'. Drillers experienced difficulty pulling string at 400' and bit was stuck at ~360' for remainder of day - the mud pump had reduced circulation and driller believed cuttings accumulated atop the bit on the way down.

(18NOV) Mud pump repaired and hole redrilled extending an additional 20' (520' total). Initial attempt to install loop failed

~350' due to debris / narrowing in hole. Redrilled hole to 520'. Second attempt got loop to 450', trimmed ~4 feet above ground, ends melted shut, tied to metal stake, and grouted with 20 bags of TG Lite and 10 bags of PowerTEC.

(20NOV) Grout settled to 18' below surface (within casing), drillers backfilled with mudchips, cleaned up, and vacated site.

Summary notes:

40 to 60' in adjacent areas may require casing due to unstable ground and large hard rock gravels (granite, basalt). This driller widened the hole to 8" down to 40' and installed 2x20' sections of locally sourced 6" dia Cresline HDPE and sealed with 3/8" bentonite hole plug. Production drillers may consider bringing preferred casing/hole plug to site as local supply/variety could be limited.

300' to TD may contain unstable carbonaceous shale lenses in adjacent areas, loop depths may vary within this range although head driller said he is confident 450' loop depth is achievable at scale.

Drilling crew were helpful, hard working, and a pleasure to work with. They spoke highly of their company and were happy with the equipment they were using.

Head driller notes:

Clarity on mud/cutting disposal prior to arriving at site would have been helpful and allowed them to coordinate disposal option prior to arrival. This could cause delays for future exploratory holes depending on local disposal options.

Locates were not done on site.

There was a lot of foot and vehicular traffic in and very near drill site. Physical boundary (snowfence) 50' around site would have been preferred due to safety/liability concerns.
